STASHLY

EVERYTHING WORTH KEEPING.

Product Concept & Complete User Flow

SAVE • ORGANIZE • FIND AGAIN

A product blueprint for a personal digital-content wallet that collects links and useful content from across apps, then makes them easy to organize and retrieve.

01 | Product Overview

Stashly is a personal digital-content wallet. Users share a link from an app into Stashly, save it with useful metadata, organize it into collections, and find it later through search and filters.

Core promise

> Save anything worth keeping. Organize it your way. Find it when you need it.

Content examples

Videos • social posts • articles • product pages • recipes • learning resources • inspiration • useful links

Product principle

In the first version, Stashly primarily stores the original URL and available metadata—not a copy of every video or image. This keeps the product simpler and avoids assuming that every platform permits downloading or full content access.

02 | End-to-End User Flow

STEP	USER ACTION	SYSTEM RESPONSE
1	Browse any app TikTok, Instagram, YouTube, browser, messaging apps	The user finds content worth keeping.
2	Tap Share Choose Stashly from the share sheet	The mobile app receives the shared URL or text.
3	Review the item Optional title, collection, tags, or note	Stashly validates the input and prepares a save preview.
4	Save	The API checks authentication and ownership, then saves the item.
5	Organize Collections, tags, favorites	The item becomes easier to browse and retrieve.
6	Find it later Search, filters, recent items	The user opens the saved record and returns to its original source.

03 | Main Screens & Responsibilities

SCREEN	PURPOSE	KEY ELEMENTS
Onboarding & Auth	Introduce the value and create a secure account.	Welcome, sign up, login, password reset, Google sign-in if implemented.
Home	Show the user's saved content at a glance.	Search bar, recent items, content-type filters, collections, quick add.
Save Preview	Let the user confirm and enrich a shared item.	URL, available title/thumbnail, collection, tags, optional note, Save action.
Item Details	Display information and actions for one saved item.	Open original link, edit, copy link, share, favorite, move collection, delete.
Collections	Group saved items by purpose.	Create/edit collections, item counts, collection-specific search.
Search	Retrieve content without remembering the source app.	Keyword search, platform/type/date filters, tags, favorites.
Profile & Settings	Manage account and preferences.	Profile, theme, language, data export/delete, sign out.

04 | Suggested Collections

COLLECTION	EXAMPLES
Learning	Courses, tutorials, documentation
Tech & AI	Tools, AI news, technical references
Shopping	Products, prices, wish-list items
Travel	Places, maps, itineraries
Inspiration	Designs, ideas, creative references
Work	Professional links, resources, tasks

05 | Technical Flow

Recommended first-version architecture

LAYER	RESPONSIBILITY
Mobile app	Receive Android share intents, display the save preview, show saved items and handle navigation.
Laravel REST API	Authentication, authorization, URL validation, item CRUD, collections, tags, search and pagination.
MySQL	Persist users, saved items, collections, tags and their relationships.
Metadata fetcher	Fetch title, favicon, preview image or Open Graph metadata when publicly available and permitted.
Queue / background jobs	Process slower metadata requests, retries and future AI classification without blocking the save flow.
Optional cloud storage	Store user-uploaded files or user-authorized attachments if that capability is added later.

Request lifecycle

01	**Share Intent**	Receive the URL or shared text from another app.
02	**Validate**	Normalize the URL, reject invalid input, and check the signed-in user.
03	**Metadata**	Retrieve available preview data; do not depend on every platform exposing it.
04	**Persist**	Store the URL, title, source, type, owner and optional organization fields.
05	**Confirm**	Return success and update the UI; make duplicate handling clear.

06 | MVP Scope & Roadmap

Phase 1 — Core product

• Authentication and per-user data isolation

• Share-to-Stashly flow on Android

• Manual URL entry as a fallback

• Saved-item list and item details

• Title/source/preview metadata when available

• Collections, tags and favorites

• Search and practical filters

• Edit and delete saved items

• Secure Laravel API and basic error handling

Phase 2 — Smart features

FEATURE	VALUE
Smart Categorization	Suggest categories from available title and metadata.
Ask Your Stash	Search saved items using natural-language queries.
Duplicate Detection	Warn about an existing URL or offer to open it.
Reminders	Let users schedule a return to a saved item.
Cross-device Sync	Access the same account from mobile and web.
Summaries	Summarize accessible text where permissions and content allow.

07 | Important Product & Technical Considerations

• Platform limitations: Shared links, titles and preview images vary by source app and platform. Always provide a manual URL entry fallback.

• Privacy: Each saved item must belong to its owner. Enforce authorization in the API, not only in the UI.

• Security: Validate URLs and protect metadata-fetching services against SSRF and unsafe redirects.

• Link vs. file: Saving a URL is not the same as downloading and storing the media. The MVP should prioritize links and permitted metadata.

• Reliability: Handle unavailable previews, private content, expired links, duplicates, offline states and retryable failures gracefully.

Product success metric
How quickly can a user save something from another app—and how easily can they find it again days or weeks later?
